ABSTRACT

Fluorescent dyes and probes are key components in multi-photon based fluorescence microscopy imaging of biological samples. In order to address the demand for better performing dyes for two-photon based imaging, a new series of reactive fluorophores tailored for multi-photon imaging has been disclosed. These fluorophores are based upon the fluorene ring system, known to exhibit high fluorescence quantum yields, typically >0.7, and possess high photostability. They have been functionalized with moieties to act, e.g., as efficient amine-reactive fluorescent probes for the covalent attachment onto, e.g., proteins and antibodies. The synthesis and the single-photon spectral characteristics, as well as measured two-photon absorption cross sections of the reactive fluorophores in solution are presented. Spectral characterizations of bovine serum albumin (BSA) conjugated with the new reactive probe is presented.

REACTIVE PROBES FOR TWO-PHOTON
FLUORESCENT IMAGING AND SENSING

This is a Divisional of application Ser. No. 11/128,497
filed May 13, 2005 now U.S. Pat. No. 7,253,287 which
claims the benefit of priority to U.S. Provisional Patent
Application No.: 60/571,202 filed May 14, 2004.

FIELD OF INVENTION

This invention relates to two-photon fluorescence im-
aging, and in particular to a class of fluorescent probes having
the properties of high fluorescence quantum yields, high
photon absorbivity and high photostability.

BACKGROUND AND PRIOR ART

Two-photon laser scanning fluorescence microscopy, first
demonstrated by Denk et al. in 1990, is based on the
simultaneous absorption of two low-energy photons by a
fluorophore in a single quantum event to induce an elec-
tronic excitation that is normally accomplished by a single
high-energy photon. The main advantage of two-photon
imaging over conventional linear microscopy stems from
the high spatial localization of this excitation event due to
the quadratic relation between the excitation and illumina-
tion intensity. Practically, this means that the excitation occurs
only at the beam focus and as ultrafast, pulsed, near-IR laser
irradiation is used as the excitation source, deeper imaging
is possible, with restricted photobleaching and phototox-
city to the exposed area of the specimen is achieved. The tenets of two-photon absorption (2PA)
enables investigations of complex biological problems and
experiments on living samples not possible with other
imaging techniques, and highlighted examples of its use in the
medicinal and biological research area have been noted.

Two-photon fluorescence methods and techniques have
advanced to yield sophisticated imaging techniques, but
conventional UV-excitatable fluorophores not optimized for
efficient 2PA continue to be utilized. Two-photon physi-
ocal characterization databases for commonly used flu-
ophores and bio-indicators have been reported. Many of
these compounds exhibit relatively low two-photon absorp-
tion cross-sections (Ω), on the order of 10 to 100 GM units.
The (Ω) parameter is an indicator of the two-photon absorp-
tion efficiency, and only recently has research been reported
on the design and development of very efficient 2PA dyes on the
order of >10 GM units. Much of the synthetic efforts have
focused on preparing new organic dyes for a range of
applications, as molecules specifically engineered for two-
photon excitation may significantly outperform standard
fluorophores optimized for single photon excitation. How-
ever, the identification and availability of optimized 2PA
fluorophores specifically tailored for labeling biomolecules
for two-photon fluorescence imaging studies are rare. To
date, reactive fluorescent dyes exhibiting high 2PA cross-
section, specifically to covalently modify biomolecules have
not been reported. Hence, the need to incorporate reactive,
efficient 2PA fluorophores for covalent attachment onto
biomolecules within the fluorophore design strategy
seems timely and fulfills an appropriate need which coinci-
des with increasing usage of two-photon excitation fluo-
rescence imaging applications in the life sciences.

Previous studies have reported on the design and develop-
ment of fluorene-based organic dyes with very efficient
two-photon absorption and fluorescence emission properties
and their use in data storage and sensing applications.

SUMMARY OF THE INVENTION

It would be highly desirable to provide a two-photon probe with the properties of high fluorescence quantum yields, of high photon absorbivity and high photostability.

2

A BSA model bioconjugate has the structural formula

and a hydrophilic amine-reactive fluorophore has the struc-
tural formula

in the present invention.
A more preferred dye adduct of the present invention is hydrophilic and has the structural formula

A preferred hydrophilic protein bioconjugate of the present invention has the structural formula

A preferred method of multiphoton imaging includes the use of reactive fluorophores upon a fluorene ring system, more preferably, the fluorophores are functionalized with moieties having the properties of covalent attachment onto proteins and antibodies.

It is also preferred that a Ti:sapphire laser be used to provide for the multiphoton imaging.

A preferred generic Two-Photon Reactive Probe Structure has the formula

wherein \( R^1 \) and \( R^2 \) are selected from the group:

\[ \text{R}^1 \in \{ \text{C}_1 \text{C}_{10} \text{alkyl}, \text{C}_1 \text{C}_{10} \text{haloalkyl}, \text{C}_1 \text{C}_{10} \text{alkoxy}, \text{C}_1 \text{C}_{10} \text{alcohol}, \text{C}_1 \text{C}_{10} \text{haloalcohol}, \text{C}_1 \text{C}_{10} \text{alkynyl}, \text{C}_1 \text{C}_{10} \text{noctyle} \} \]

\[ \text{R}^2 \in \{ \text{C}_1 \text{C}_{10} \text{alkyl}, \text{C}_1 \text{C}_{10} \text{haloalkyl}, \text{C}_1 \text{C}_{10} \text{alkoxy}, \text{C}_1 \text{C}_{10} \text{alcohol}, \text{C}_1 \text{C}_{10} \text{haloalcohol}, \text{C}_1 \text{C}_{10} \text{alkynyl}, \text{C}_1 \text{C}_{10} \text{noctyle} \} \]

\[ X \in \{ \text{C}_1 \text{C}_{10} \text{alkyl}, \text{C}_1 \text{C}_{10} \text{haloalkyl}, \text{C}_1 \text{C}_{10} \text{alkoxy}, \text{C}_1 \text{C}_{10} \text{alcohol}, \text{C}_1 \text{C}_{10} \text{haloalcohol}, \text{C}_1 \text{C}_{10} \text{alkynyl}, \text{C}_1 \text{C}_{10} \text{noctyle} \} \]

\[ Y \in \{ \text{C}_1 \text{C}_{10} \text{alkyl}, \text{C}_1 \text{C}_{10} \text{haloalkyl}, \text{C}_1 \text{C}_{10} \text{alkoxy}, \text{C}_1 \text{C}_{10} \text{alcohol}, \text{C}_1 \text{C}_{10} \text{haloalcohol}, \text{C}_1 \text{C}_{10} \text{alkynyl}, \text{C}_1 \text{C}_{10} \text{noctyle} \} \]

R\(^2\), X, and Y are all functionality tailored for specific applications

5

A preferred two-photon fluorophore labeled protein of the present invention has the formula

\[ \text{N}^3 \text{C}^3 \text{C}_6 \text{alkyl}, \text{N}^3 \text{C}^3 \text{C}_6 \text{haloalkyl}, \text{N}^3 \text{C}^3 \text{C}_6 \text{alcohol}, \text{N}^3 \text{C}^3 \text{C}_6 \text{haloalcohol}, \text{N}^3 \text{C}^3 \text{C}_6 \text{alkoxyl} \]

\[ \text{N}^3 \text{C}^3 \text{C}_6 \text{alcohol}, \text{N}^3 \text{C}^3 \text{C}_6 \text{haloalcohol}, \text{N}^3 \text{C}^3 \text{C}_6 \text{alkynyl}, \text{N}^3 \text{C}^3 \text{C}_6 \text{noctyle} \]

\[ \text{N}^3 \text{C}^3 \text{C}_6 \text{alkyl}, \text{N}^3 \text{C}^3 \text{C}_6 \text{haloalkyl}, \text{N}^3 \text{C}^3 \text{C}_6 \text{alcohol}, \text{N}^3 \text{C}^3 \text{C}_6 \text{haloalcohol}, \text{N}^3 \text{C}^3 \text{C}_6 \text{alkynyl}, \text{N}^3 \text{C}^3 \text{C}_6 \text{noctyle} \]

The present invention also includes a preferred two-photon fluorophore labeled antibody having the formula

\[ \text{N}^3 \text{C}^3 \text{C}_6 \text{alkyl}, \text{N}^3 \text{C}^3 \text{C}_6 \text{haloalkyl}, \text{N}^3 \text{C}^3 \text{C}_6 \text{alcohol}, \text{N}^3 \text{C}^3 \text{C}_6 \text{haloalcohol}, \text{N}^3 \text{C}^3 \text{C}_6 \text{alkynyl}, \text{N}^3 \text{C}^3 \text{C}_6 \text{noctyle} \]

wherein \( R^1 \) and \( R^2 \) are selected from the group:

\[ \text{N}^3 \text{C}^3 \text{C}_6 \text{alkyl}, \text{N}^3 \text{C}^3 \text{C}_6 \text{haloalkyl}, \text{N}^3 \text{C}^3 \text{C}_6 \text{alcohol}, \text{N}^3 \text{C}^3 \text{C}_6 \text{haloalcohol}, \text{N}^3 \text{C}^3 \text{C}_6 \text{alkynyl}, \text{N}^3 \text{C}^3 \text{C}_6 \text{noctyle} \]

wherein \( Y \) is selected from the group:

\[ \text{N}^3 \text{C}^3 \text{C}_6 \text{alkyl}, \text{N}^3 \text{C}^3 \text{C}_6 \text{haloalkyl}, \text{N}^3 \text{C}^3 \text{C}_6 \text{alcohol}, \text{N}^3 \text{C}^3 \text{C}_6 \text{haloalcohol}, \text{N}^3 \text{C}^3 \text{C}_6 \text{alkynyl}, \text{N}^3 \text{C}^3 \text{C}_6 \text{noctyle} \]

wherein \( Y \) is selected from the group:

\[ \text{N}^3 \text{C}^3 \text{C}_6 \text{alkyl}, \text{N}^3 \text{C}^3 \text{C}_6 \text{haloalkyl}, \text{N}^3 \text{C}^3 \text{C}_6 \text{alcohol}, \text{N}^3 \text{C}^3 \text{C}_6 \text{haloalcohol}, \text{N}^3 \text{C}^3 \text{C}_6 \text{alkynyl}, \text{N}^3 \text{C}^3 \text{C}_6 \text{noctyle} \]

wherein Y is selected from the group:

\[ \text{N}^3 \text{C}^3 \text{C}_6 \text{alkyl}, \text{N}^3 \text{C}^3 \text{C}_6 \text{haloalkyl}, \text{N}^3 \text{C}^3 \text{C}_6 \text{alcohol}, \text{N}^3 \text{C}^3 \text{C}_6 \text{haloalcohol}, \text{N}^3 \text{C}^3 \text{C}_6 \text{alkynyl}, \text{N}^3 \text{C}^3 \text{C}_6 \text{noctyle} \]

wherein Y is selected from the group:

\[ \text{N}^3 \text{C}^3 \text{C}_6 \text{alkyl}, \text{N}^3 \text{C}^3 \text{C}_6 \text{haloalkyl}, \text{N}^3 \text{C}^3 \text{C}_6 \text{alcohol}, \text{N}^3 \text{C}^3 \text{C}_6 \text{haloalcohol}, \text{N}^3 \text{C}^3 \text{C}_6 \text{alkynyl}, \text{N}^3 \text{C}^3 \text{C}_6 \text{noctyle} \]
2-benzothiazolyl substituted with 0-4 R³; 2-styrylbenzothiazolyl; 2-benzoxazolyl substituted with 0-4 R²; and 2- or 4- pyridyl substituted with 0-4 R³, and N-carbazolyl substituted with 0-4 R³; and

R³ is independently amino, hydroxy, halogen, C₁-C₆ alkoxy, C₁-C₆ haloalkyl, SH, SCH₂, —NH(C₁-C₆ alkyl), —N(C₁-C₆ alkyl)₂, —NH(aryl), —N(aryl)₂, —NHCO(C₁-C₆ alkyl), —N—C=S, —NH(C=S)—O(C₁-C₆ alkyl), —NH(C=S)—NH(C₁-C₆ alkyl), —NH(C=S)—N(C₁-C₆ alkyl)₂, —CO₂H, or —CO₂(C₁-C₆ alkyl).

Further objects and advantages of this invention will be apparent from the following detailed description of the presently preferred embodiment which are described in the following text.

BRIEF DESCRIPTION OF THE FIGURES

DETAILED DESCRIPTION OF THE INVENTION

Before explaining the disclosed embodiment of the present invention in detail it is to be understood that the invention is not limited in its application to the details of the particular arrangement shown since the invention is capable of other embodiments. Also, the terminology used herein is for the purpose of description and not of limitation.

To better understand this invention set forth, recall that the fluorogenic ring is a δ-conjugated system which allows for facile synthetic manipulation, yielding dyes with tailored spectral properties. Efforts directed towards preparing reactive fluorescent dyes have been initiated with the synthesis of an amine-reactive dye for labeling, e.g., lysine residues on proteins. A model dye-adduct exhibiting high fluorescence quantum yield (QY=0.74) was also prepared by reacting an amine-reactive dye with n-butyl-amine to test its reactivity as an amine-reactive fluorescent label and determine its spectroscopic properties. Additionally, a model protein bioconjugate was prepared with the reactive fluorophore and bovine serum albumin. Finally, a hydrophilic derivative of an amine-reactive dye was prepared to obtain a more water-soluble dye. The foregoing will become apparent upon reading the following experimental discussion.

EXPERIMENTAL

Reference should now be made to FIG. 1. The synthesis of an amine reactive fluorescent dye (1) was prepared as a biological labeling probe (Scheme 1). Intermediate compounds A-F have been described previously in the literature. Preparation of reactive probe 1, from aminofluorescein F, was performed quantitatively, following the literature protocol. The procedure for preparation of reactive probe 1 is shown in FIG. 1. Compound (1) was prepared as an amine-reactive fluorescent dye, containing the isothiocyanate functionality that can react with primary amine groups present on protein molecules. A model dye-adduct (2) was also prepared by reacting (1) with a n-butyl-amine to test its reactivity as an amine-reactive fluorescent label (FIG. 1). Preparation of the model adduct allowed for facile single- and two-photon spectroscopic characterizations that more closely resembles the bioconjugate than that of the reactive fluorophore alone.

The amine-reactive fluorescent dye (1) was used to prepare a bioconjugate (3) with bovine serum albumin (BSA) protein as a model biomolecule (which is shown in FIG. 2). The use of BSA, an inexpensive protein that has been extensively characterized, is ideal for establishing optimal conditions to obtain a model bioconjugate allowing for subsequent spectroscopic characterization.

The amine reactive reagent (isothiocyanate functional group) reacts with non-protonated aliphatic amine groups, including the N-terminals of proteins and the ε-amino groups of lysines (pKa=10.5). A typical protocol for the conjugation was followed in an amine-free buffer with a slightly basic pH (pH=9.0). The amine reactive dye (1) was dissolved in DMSO, immediately prior to addition into the stirring BSA protein solution. The reaction mixture was allowed to stir at
room temperature, after which it was passed through a Sephadex G-25 gel filtration column pre-swollen with water and equilibrated with phosphate buffer saline (PBS, pH 7.2) solution. Small fractions, eluted with the PBS solution were collected into sterile plastic tubes, and the UV-visible absorption and steady-state fluorescence emission spectra of the bioconjugate were obtained.

Two different molar ratios of the reactive dye to protein were performed to assess the reactivity of the dye for its degree of labeling (DOL) (Table 1). The degree of labeling was estimated using average values from standard equations obtained from reference 25.

**RESULTS AND DISCUSSION OF THE INVENTION**

The normalized UV-visible absorption and steady-state fluorescence emission spectra of the free reactive fluorophore (1) and the dye adduct (2) in DMSO are shown in FIG. 4. The free reactive fluorophore exhibits two absorption maxima at approximately 357 and approximately 375 nm, along with two emission maxima at approximately 384 and approximately 404 nm. The dye adduct instead exhibits a single absorption maximum at approximately 363 nm with an emission maximum at approximately 403 nm, and is well resolved from that of its absorption spectrum, with minimal spectral overlap. The fluorescence quantum yield (Rhamine 6G in ethanol as a standard) of the reactive fluorophore in DMSO was approximately 0.02, while that of the dye adduct in DMSO increased significantly to approximately 0.74, indicating the fluorescence of the reactive dye should be restored upon conjugation to a biomolecule.

The two-photon absorption cross sections (from two-photon fluorescence measurements) for the dye adduct in DMSO was obtained under femtosecond (fs) near IR irradiation (FIG. 5c). The linear, single photon absorption spectrum is shown as the line profile, while the two-photon absorption cross sections were measured at wavelengths that were twice that of the linear absorption, and are shown as the data points. The y-axis is shown as two near-IR photons used to obtain the cross section converted to an equivalent single photon wavelength. The two-photon absorption cross section at the energy of the linear absorption maximum near 370 nm is approximately 25 GM units. Interestingly, while the linear absorption spectrum for the compound does not display any significant absorption at the shorter wavelengths, the value of the two-photon absorption cross section increases. To ensure the dye adduct undergoes 2PA, a log-log plot of the fs pump power to that of the integrated fluorescence was constructed. As can be seen from FIG. 5b, the slopes from the measurements confirm the quadratic dependence characteristic of fluorescence obtained from two-photon absorption.

FIGS. 5a-5b show the two-photon cross section of the dye adduct in FIG. 5a, and the log-log plot of its integrated fluorescence as a function of pump power variation at two different fs excitation wavelengths in FIG. 5b. The normalized absorption and steady-state fluorescence emission spectra of the BSA-dye bioconjugate (3) in PBS buffer (pH 7.2) is shown in FIG. 6. For reference, the absorption spectrum of the free BSA protein in PBS solution is also shown. The BSA-dye conjugate displays absorption peaks corresponding to that of the BSA protein in the shorter wavelength range (δmax=280 nm), as well as that of the fluorescence emission of longer absorption range (δmax=360 nm and 380 nm). The fluorescence emission of the bioconjugate is broad and exhibits an appreciable Stoke’s shift. An appreciable bathochromic shift in the fluorescence emission was observed in the BSA-dye conjugate relative to that of the free reactive fluorophore, and with a similar broadening observed in the absorption profile, the fluorescence emission was also broader than that of the free fluorophore. The observed Stoke’s shift in the free dye was about 45 nm, while that of the BSA-dye conjugate was much greater (Stoke’s shift=73 nm upon δex=360 nm, and 53 nm upon δex=380 nm). The fluorescence emission profile of the BSA-dye conjugate upon excitation at δex=360 nm and δex=380 nm yielded similar fluorescence intensities.

The spectroscopic profiles of the BSA-dye conjugate validate the use of the reactive dye (1) to form bioconjugates with protein biomolecules for fluorescence imaging applications. However, attempts to conjugate the dye onto an anti-BSA antibody (Molecular Probes) were unsuccessful. The two hydrophobic alkyl chains on the fluorescent ring may have interfered with efficient conjugation onto the higher molecular weight of the antibody (~150 kDa) relative to that of the smaller protein (~65 kDa). Hence, a more hydrophilic derivative of an amine-reactive dyes was prepared (compound 4 of FIG. 3). Substitution of the alkyl groups on the fluorescent ring with carboxylates should enhance the water solubility of the reactive dye, and is expected to improve its conjugation to a wider range of biomolecules in aqueous media. The FT-IR spectrum of the hydrophilic reactive dye (4) displayed a strong NCS stretch at 2118 cm⁻¹, indicating the presence of the amine-reactive functionality. Efforts to prepare appropriate adducts and bioconjugates with the hydrophilic dye (4) are currently underway.

A new series of reactive fluorophores have been prepared to covalently label biomolecules for multiphoton imaging. These fluorophores are based upon the fluorescence ring system and exhibit high fluorescence quantum yields upon bioconjugation (~0.7). They have been functionalized with moieties to act, e.g., as efficient amine-reactive fluorescent probes for the convoluted attachment onto, e.g., proteins and antibodies. A bovine serum albumin (BSA) conjugate with a new reactive probe has been demonstrated. Additionally, a hydrophilic reactive fluorophore has been prepared, expected to be more efficient for labeling biomaterials in aqueous media. These efficient two-photon absorbing reactive dyes are expected to be versatile probes for multiphoton bio-imaging applications.

In summary, there is disclosed numerous structures and the preparation provided by the teachings of this invention: the dye adduct
A hydrophilic amine-reactive fluorophore having the structural formula

The dye adducts that are hydrophilic and have the structural formulae

Generic Two-Photon Reactive Probe Structure

A BSA model bioconjugate having the structural formula

R¹, R², X, and Y are all functionality tailored for specific applications
wherein R¹ and R² are selected from the group:

- R¹ and R², at each occurrence, are independently C₇-C₁₆ alkyl, C₂-C₁₀ haloalkyl, -(CH₂)₉-CO₂H, -(CH₂)₉-CO₂(C₂-C₆ alkyl), -(CH₃CH₂O)₉-CO₂H, -(CH₃CH₂O)₉-CO₂(C₂-C₆ alkyl); -(CH₂CH₂O)₉-CO₂(C₂-C₆ alkyl); -(CH₃CH₂O)₉-CO₂H; or -(CH₂CH₂O)₉-CO₂-N-succinimidyl;

wherein X is selected from the group:

R\(^1\) and R\(^2\) are selected from the group wherein:

R\(^1\) and R\(^2\), at each occurrence, are independently C\(_1\)C\(_6\) alkyl, C\(_1\)C\(_6\) haloalkyl, \( \text{CH}_2 \), \( \text{CO}_2 \), \( \text{CO}_2(C_1-C_6 \) alkyl), \( \text{CH}_2CH_2O_\), \( \text{CO}_2(C_1-C_6 \) alkyl); \( \text{CH}_2CH_2O_\), \( \text{CO}_2(C_1-C_6 \) alkyl); \( \text{CH}_2\), \( \text{CO}_2 \); \( \text{CO}_2(C_1-C_6 \) alkyl); \( \text{CH}_2\), \( \text{CO}_2 \); \( \text{CO}_2(C_1-C_6 \) alkyl), or \( \text{CO}_2(C_1-C_6 \) alkyl).

wherein Y is selected from the group:

-\( \text{NH}_2 \), -\( \text{NH}(C_1-C_6 \) alkyl), -\( N(C_1-C_6 \) alkyl)\), -\( \text{NH} \) (aryl), -\( N(\text{aryl}) \), -\( \text{NHCO}(C_1-C_6 \) alkyl), 2-thiazolyl substituted with 0-2 R\(^2\), 2-oxazolyl substituted with 0-2 R\(^2\); 2-benzothiazolyl; 2-benzoxazolyl substituted with 0-4 R\(^3\); and 2- or 4-pyridyl substituted with 0-4 R\(^3\), and N-carbazolyl substituted with 0-4 R\(^3\);

R\(^3\) is independently amino, hydroxy, halogen, C\(_1\)C\(_6\) alkoxy, C\(_1\)C\(_6\) halalkyl, SH, S\(\text{CH}_2\), -\( \text{NH}(C_1-C_6 \) alkyl), -\( N(C_1-C_6 \) alkyl)\), -\( \text{NH}(C=\text{S}) \), -\( \text{NH}(C_1-C_6 \) alkyl), -\( N(C_1-C_6 \) alkyl)\), -\( \text{CO}_2 \), or -\( \text{CO}_2(C_1-C_6 \) alkyl).
R³ and 2- or 4-pyridyl substituted with 0-4 R³, and N-carbazoyl substituted with 0-4 R³;
R³ is independently amino, hydroxy, halogen, C₁-C₆ alkoxy, C₆-C₁₅ alkyl, C₆-C₁₅ haloalkyl, SH, SCH₃,
—NH(C₁-C₆ alkyl), —N(C₁-C₆ alkyl)₂, —NH(aryl),
—N(aryl)₂, —NHCO(C₆-C₁₅ alkyl), —N=C=S,
—NH(C=O)—O(C₁-C₆ alkyl), —NH(C=O)—NH(C₁-C₆ alkyl), —NH(C=O)—N(C₁-C₆ alkyl)₂, —CO₂H, or
—CO₂(C₁-C₆ alkyl);
or a two-photon fluorophore labeled antibody of the formula

\[
\text{Protein} \xrightarrow{\text{H}} \text{R¹} \xrightarrow{\text{Y}} \text{R²}
\]

R¹ and R² are selected from the group wherein;
R¹ and R², at each occurrence, are independently C₁-C₁₅ alkyl, C₆-C₁₀ haloalkyl, —(CH₃)₃CO₂H, —(CH₃)₉CO₂(C₁-C₆ alkyl), —(CH₃CH₂OH)₃H, —(CH₃CH₂O)₄H(C₁-C₆ alkyl); —(CH₃CH₂O)₅H

(CO₂C₁-C₆ alkyl); —(CH₂CH₂O)₅H(CO₂); or
—(CH₂CH₂O)₆H(CO₂)—N-succinimidyl;
wherein Y is selected from the group:
—NH₂, —NH(C₁-C₆ alkyl), —N(C₁-C₆ alkyl)₂, —NH(aryl),
—N(aryl)₂, —NHCO(C₁-C₆ alkyl), 2-thiazolyl substituted with 0-2 R³; 2-oxazolyl substituted with 0-2 R³;
2-benzothiazolyl substituted with 0-4 R³; 2-styrylbenzothiazolyl; 2-benzoxazolyl substituted with 0-4 R³;
and 2- or 4-pyridyl substituted with 0-4 R³, and N-carbazoyl substituted with 0-4 R³;
R³ is independently amino, hydroxy, halogen, C₁-C₆ alkoxy, C₆-C₁₀ alkyl, C₆-C₁₅ haloalkyl, SH, SCH₃,
—NH(C₁-C₆ alkyl), —N(C₁-C₆ alkyl)₂, —NH(aryl),
—N(aryl)₂, —NHCO(C₁-C₆ alkyl), —N=C=S,
—NH(C=O)—O(C₁-C₆ alkyl), —NH(C=O)—NH(C₁-C₆ alkyl), —NH(C=O)—N(C₁-C₆ alkyl)₂, —CO₂H, or
—CO₂(C₁-C₆ alkyl).

2. The method according to claim 1 wherein said fluorophores are functionalized with moieties having the properties of covalent attachment onto proteins and antibodies.

3. The method according to claim 1 wherein a Ti:sapphire laser is used to provide for the multiphoton imaging.
